

Systematic Liquid Alternatives

The Stress-Regime Alpha Platform

Two Engines. One philosophy. Governed Returns When Markets Reprice Risk.

We monetise the measurable mechanics of market stress that being volatility repricing, dispersion and correlation strain across highly liquid G10 FX and listed equity index derivatives, built for unstable and unpredictable regimes.

Edge Capital Institutional Platform, Not a Product

“Edge Capital Institutional is a systematic liquid alternatives platform established in 2015, built for one portfolio function: governed returns when markets repricerisk. We do not rely on narratives, discretionary forecasting, or single-scenario positioning; instead, we run repeatable, research-led systems designed to monetise the measurable consequences of stress. Edge Capital is a platform, not a product: two differentiated systematic engines with distinct return drivers, governed by a single operating framework and a unified risk architecture.”

Modern markets operate in recurring shock regimes

Three times since 2020, diversified portfolios failed investors when they needed protection most.

Markets do not break down gradually. They reprice in weeks. Three shock regimes since 2020 a pandemic that wiped 20% off equities in five weeks, a war in Europe that broke the 60/40 assumption with stocks and bonds falling together, and now a war in the Middle East compounding trade fragmentation and the largest energy disruption in modern history.

Global stocks -8%, bonds -2%, gold -14%. Everything down. At the same time. Again.

This time the escape routes are closed too. Bonds are selling off alongside equities when the shock is inflationary, fixed income offers no shelter. The Fed is trapped between fighting energy-driven inflation and a weakening economy. Europe faces a full-blown energy crisis with gas prices doubling. And gold, despite rallying 75% over two years, dropped 14% in this regime.

The playbook that protected institutional portfolios for three decades is failing in real time. Not because the assets changed. Because the regime did.

| Our solution to these markets

We Earn From the Same Stressed Markets That Hurts Traditional Portfolios

Traditional portfolios are built to survive stress. The Edge Capital Stress regime alpha platform is built to earn from it.

When implied volatility spikes, institutions pay elevated premiums for protection, that surplus flows directly to us. When FX correlations fracture under geopolitical or macro stress, dislocations widen and our convergence opportunities multiply.

This is not a low-correlation claim. It is a structural inversion. The conditions that damage institutional portfolios are the same conditions that generate our returns.

When markets reprice risk

Traditional portfolios	EDGE CAPITAL Stress regime alpha platform
------------------------	--

Implied vol spikes

↓ Equities fall → portfolios lose

↑ VPR earns more premium

FX correlations break

↓ Portfolio diversification fails

↑ CA opportunity set grows

Liquidity thins

↓ Equities fall → portfolios lose

↑ VFX dislocations deepen → convergence trades

Stocks & bonds fall together

↓ 60/40 fails

↑ Independent return drivers activate

VIX above 40

↓ Forced hedging and selling

↑ Institutions pay peak protection premium

The Stress-Regime Alpha Platform

The Stress-Regime Alpha Platform earns from the mechanics that cause drawdowns not despite them. Two systematic engines harvest volatility repricing and FX correlation dislocations in the most liquid markets. The result: a return sleeve that generates independently and earns more precisely when 60/40 portfolios are under the most pressure.

What is it?

A structural inversion, not just diversification

This platform earns from stress, not despite it. The conditions that cause drawdowns, vol repricing and FX correlation breakdown, grow the opportunity set for both engines. Two engines, one trigger: stress.

How does it work?

VPR + CA, governed, systematic, beta-neutral

VPR: institutions overpay for near-term protection when fear rises we harvest that gap via delta-hedged ODTE S&P 500 options. CA: FX relationships dislocate under stress and mechanically revert, we trade it via beta-neutral baskets.

Why does it persist?

Structural demand, not a fragile arbitrage signal

VPR: institutional hedging is non-discretionary, risk limits cannot be switched off. CA: G10 FX structural pipes enforce reversion every cycle. **Live proof: VPR +28.35%, CA +18.60% in FY 2022 vs MSCI -19.3%.**

VPR Engine: Higher VIX → institutions overpay for near-term protection → implied/realised vol gap widens → richer premium captured. The structural premium grows with the stress regime.

CA Engine: Higher FX correlation instability → wider dislocations → more convergence trades → higher returns. The moving average confirms: the opportunity set grows in stressed regimes.

Two independent funds. One portfolio job.

Portfolio role: A liquid resilience sleeve that generates returns independently of equity and rate beta and earns more precisely when 60/40 portfolios are under the most pressure. **Both engines available as standalone allocations or in combination.**

Engine 01 - Stand alone fund

Market Neutral Volatility Premium Risk

What we monetise

Shock-driven repricing of implied vol and skew in S&P 500 index derivatives. When uncertainty rises, institutions pay elevated premiums for near-term protection. We harvest that systematically via short-dated options.

How we stay neutral

Active delta-hedging via ES futures under predefined rules. Primarily ODTE. XGBoost ML engine recalibrates hedge triggers in real time from live regime inputs. No directional equity bet returns come from premium mechanics.

Team & Performance culture

Every Edge Compounds.

“Most people try to optimize performance at work. We optimize the person behind it. Because consistent results are a reflection of consistent behavior.”

Paul Lamain — Founder & Head of Institutional

The same logic that runs the strategies runs the team. Performance is not negotiated in the moment it is built long before, through predefined standards, applied consistently, refined continuously. What follows is the operating system that supports it.

How we operate defines how we perform

Health & recovery

Drift is managed before it becomes drawdown

Health and recovery are recognized as performance variables, not personal matters. The firm builds time, space, and supporting standards into the operating environment recognizing that consistent results require a consistent operator. The discipline of how each professional uses that space remains their own.

- Time and flexibility for sleep, training, and recovery are built into the operating week
- Shared standards around health and recovery are part of the culture
- Frameworks and resources are made available to those who choose to use them
- Early awareness of drift is part of the operating philosophy

Professional development

The team evolves faster than the markets it operates in

Models evolve, markets evolve the firm provides structure, time, and resources for the team to evolve faster. Learning is encouraged as research input, not as obligation: shared, applied, and open to challenge. Insights find their way back into how the team thinks, acts, and executes.

- Time for study, research, and reflection is built into the working week
- Themes span quantitative finance, options theory, probability, and risk
- Resources and frameworks for self-directed learning are offered
- Findings are shared and challenged within the team

Physical training

Capacity is built through structured consistency

Physical capacity is treated as part of the performance equation. The firm provides time, flexibility, and a supporting environment recognizing that compound strength and consistent effort over years build the capacity that consistent execution requires. The shape of each training program remains with each professional

- Time and flexibility for physical training are built into the operating week
- A culture that values long-term investment over seasonal effort is in place
- Supporting resources and frameworks are made available
- Consistency over intensity is the shared standard

Mental performance

The structure delivers performance. The team supports the structure

In a market-neutral, automated firm, the structure delivers the performance, and the team's role is to support it. The firm makes external expertise, frameworks, and partnerships available to support decision-making, focus, and the discipline of operating within the system to be used as each professional sees fit.

- Frameworks for decision-making and human intervention are defined in advance
- External expertise and partnerships are made available
- Focus and pressure handling are recognized as developable
- Support is offered, never imposed

Partnerships grounded in shared discipline.

We work with a small number of professionals whose standards of preparation and discipline align with how we operate. Not sponsorships. Real relationships, built on the same principles that define our investment process.

Firm Ambassador

Nyck de Vries

Formula E · Endurance Racing

The Partnership

This is not a logo on a jersey. Nyck works with us week to week on team development, coaching, and the performance standards we hold ourselves to. The values that make the difference in elite motorsport are the same values that make the difference in systematic asset management: performance, discipline, and long-term thinking.

“The people running a systematic fund are themselves a system. And systems compound.”

Management Team

A team built on shared conviction.

Edge Capital is built by people who have chosen the same standard. Every role is fully owned and every person operates at 110%, every working day, because the culture demands it and because they believe in what we are building.

This is the foundation on which Every Edge Compounds.

Paul Iamain

Founder & Head of Institutional sales

Founder of Edge Capital (2015). Leads institutional distribution and serves as Managing Advisor on strategy governance. Prior: Head of Retail Asset Management, JRC Capital Management Berlin; Director, Algorithmic Services. 10+ years as principal.

Teagan de Groot

CEO Edge Capital

AFM-registered responsible person. Leads compliance, client operations & public representation (Business Class RTL 7). BBA Hogeschool Inholland. Previously: Hudson's Bay Netherlands, Albert Heijn. Edge Capital since 2020.

Aron Broeken

Head of Institutional Business development

Leads institutional distribution, investor relations & strategic partnerships. Co founder Daily Green Fund Luxembourg (COO). Algorithmic trading development since 2017. 10+ years in financial markets. Formal CEO succession trajectory 2026–2030.

Secretary and Treasurer of the Trust Bonds Foundation Edge Capital

Secretary/Treasurer Stichting Trust Obligaties Edge Capital. Director Staalfederatie Nederland 32 years (2006–2021). Executive Board Member EURANIMI Brussels. Register Association Executive (RAE). TU Delft, Nyenrode AVVM.

Market Neutral Volatility Premium Risk

Stress-driven repricing of implied vol and skew is not a fragile signal it is a structural insurance premium tied to the ongoing need for institutional hedging.

What we monetise: When uncertainty rises, institutions pay elevated premiums to manage drawdowns, stay within risk limits, and avoid forced-selling. That flow repeatedly pushes short-dated implied vol and skew above what subsequently realises. We harvest that gap systematically without taking equity direction risk. The mechanism reappears every time regimes elevate. It cannot arbitrage away because the underlying need for institutional protection is permanent.

01

When Markets Reprice Fear, Institutions Pay

Every time uncertainty spikes, institutions allocate budget to immediate protection to manage drawdowns, stay within risk limits, and avoid forced-selling. That demand consistently pushes short-dated implied volatility and skew above what subsequently realises. The gap is not an anomaly. It is a structural insurance premium that reappears every time regimes elevate.

02

We Stand on the Other Side. Systematically.

We harvest that premium primarily via same-day options, positioned at the moment repricing is sharpest and the gap between implied and realised vol is widest. When conditions justify it, we selectively extend into longer-dated options to capture repricing further out the curve. Active delta-hedging via ES futures removes equity direction as the driver throughout. Returns come from the mechanics of fear pricing, not from being right about where markets go.

03

When Markets Reprice Fear, Institutions Pay

Active delta-hedging via ES futures under predefined rules removes equity direction as the driver. Returns come from option pricing mechanics not from being right about where markets go. Beta: -0.15 . Correlation: -0.18 .

Rolling 12-Month Beta and Correlation vs MSCI World (URTH proxy)
Volatility Premium Risk Engine

Signal to exit a governed, repeatable loop

Execution is systematic and consistent every step guided by the same regime-aware framework

We start by removing directional risk. What’s left is Vega and Gamma and we govern those too.

What’s left is Vega and Gamma and we govern those too.

What we remove 01 Directional equity riskClassify Most alternatives carry hidden equity beta. When markets fall, they fall too. That is not diversification it is correlation in disguise. We actively remove this. Every option position is continuously delta-hedged via ES futures under pre-defined rules. Index direction does not drive P&L. Sell OTM ODTE options · Hedge via ES futures · XGBoost recalibration	What Remains, Primary 02 Vega and Gamma risk Removing directional exposure changes the risk set it doesn’t eliminate it. A delta-neutral position still carries two primary non-linear exposures that require active management. Vega Vol surface repricing Implied vol and skew can reprice sharply without any directional equity move P&L is affected even in a perfectly delta-neutral position. Gamma Hedge lag in fast markets In flash-crash conditions, option delta changes faster than hedging can react brief unhedged exposure. This is where perfect delta-hedging temporarily breaks down.	Also governed 03 The remaining risk set Three further risks remain after removing directional, vega, and gamma exposure. Each has a defined protocol. Gap Risk Hard caps + event gates + VIX de-risk protocol. Liquidity & Margin Liquidity-first sizing + step-down de-grossing triggers. Execution risk Tolerance bands + automated escalation alerts.
---	---	--

We start by removing directional risk. What’s left is Vega and Gamma and we govern those too.

What’s left is Vega and Gamma and we govern those too.

Risk	What it is	How we manage it
01 Medium Gap Risk Overnight / Intraday	Sudden moves hit P&L before hedges can adjust. On opens or around macro events, ES gaps before any trade is possible. ODTE structure amplifies sensitivity.	Hard exposure caps pre-session. Event/regime gates block entries around macro announcements. Rapid VIX/VIX1D de-risk protocol triggers before loss limits are hit.
02 Medium Hedge Lag / Gamma Risk	In flash-crash conditions, option delta changes faster than ES hedging can react creating brief unhedged directional exposure at the worst possible moment.	XGBoost recalibrates hedge triggers from live regime inputs. If hedge quality drops below threshold, gross is reduced not the hedge increased. Full close if structural.
03 Medium Vol-of-Vol / Skew Shifts	Implied vol and skew surfaces reprice sharply without any directional equity move P&L impact even in a perfectly delta-neutral position.	Vol/skew regime filters monitor surface structure. Vega sensitivity limits cap exposure. Stand-down rules activate when repricing becomes structurally disorderly.
04 Managed Liquidity & Margin Dynamics	In stress, bid-offers widen and margin requirements rise sharply. Forced de-risking can dominate outcomes if sizing is not pre-managed.	Liquidity-first execution in SPX/ES ecosystem. Continuous margin monitoring. Step-down de-grossing triggers activate before margin thresholds are approached.
05 Managed Execution Risk	Latency, poor fills, or data-feed disruptions create unintended directional exposure especially during high-volume stress episodes.	Tolerance bands and automated alerts monitor hedge slippage and abnormal P&L. Escalation protocol triggers automatic position review if fills deviate materially.

FX CORRELATION ARBITRAGE

FX structural pipes rate differentials, global hedging flows, cross-rate consistency keep operating in crises. What changes is speed and dispersion. That is the repeatable edge.

What we monetise: Temporary relative-value dislocations inside normally stable G10 FX relationships driven by liquidity stress, positioning shifts, and event risk. We continuously map a network of correlation baskets, identify when legs breach calibrated equilibrium bands, and implement convergence baskets that target re-alignment. The structural drivers of FX co-movement do not disappear in crises they create more dislocations for us to harvest.

01

The Edge Lives in Market Structure, Not Forecasting

G10 FX is the world’s primary hedging and funding market. Rate differentials, trade flows, and central bank divergence continuously push currency pairs out of structural alignment driven by institutional behaviour, not randomness. When they dislocate, the pull back is mechanical. The CA engine captures that reversion systematically. No directional view. No macro forecast. The opportunity refills every cycle because the forces behind it never disappear.

02

Beta-Neutral by Design

Every position is a hedged long/short FX basket around a synthetic equilibrium band. Hedge ratios remove broad FX direction USD moves, carry shocks, risk-on/off as a return driver. Neutrality is enforced at basket and portfolio level through hard limits, concentration caps, and residual exposure monitoring. When hedges drift, we re-hedge. When correlations break structurally, the engine switches off and de-risks in controlled slices.

03

A Genuine Diversifier. Not Just Uncorrelated on Paper.

Beta to MSCI World: 0.047. Correlation: 0.154. In 2022 when equities and bonds fell simultaneously the CA engine delivered its third consecutive +20% year. The strategy structurally benefits from the conditions that hurt traditional allocations: elevated volatility, cross-currency dispersion, and institutional repositioning. These are precisely when dislocation widens and the opportunity set expands. A liquid, low-beta return stream that tends to do more when everything else does less.

24/5 scanning to exit systematic, beta-neutral by construction

Every signal is expressed as a single hedged basket. No discretionary FX macro calls the system enforces neutrality at both basket and portfolio level.

Beta-neutral by construction.

Broad FX direction and equity beta are engineered out at signal level. No discretionary overrides. Hard logic for every failure mode including the critical one.

OCT 2022 RISK-ENGINE UPGRADE Live data 2016–2022 · Real-time vol scaling · Regime filters · Automatic OFF-switch · Faster de-risk cadence Sharpe 2.60 · Max DD –1.72% · Calmar 6.28

Basket Construction How beta stays near-zero 01 01 One hedged basket per signal Hedge ratios calibrated to minimise sensitivity to USD direction, risk-on/off, and carry shocks. 02 Basket-specific equilibrium bands Each basket uses its own calibrated band not a universal threshold. Signals stay robust when stress reshapes cross-currency dynamics. 03 Reserve-commodity geometry Reserve FX ~43.5% / Commodity FX ~42.3%. Enforced by proprietary scorecard to prevent drift. 04 Portfolio-level neutrality overlay Hard gross/net limits and concentration caps enforced continuously across all active baskets.	What Remains, Primary How risk stays bounded in practice 02 Regime-conditioned position sizing Sizing is not fixed it adjusts continuously with the vol regime. In elevated uncertainty, budgets are smaller by design before any risk is taken. Dynamic hedge recalibration Hedge ratios recalibrate systematically as volatility, co-movement, and liquidity conditions change. Neutrality tightens automatically as regimes shift. Real-time residual exposure monitoring USD-bloc, carry, and regional FX aggregation monitored across all active baskets simultaneously. If exposure drifts, tighten hedges or cut gross not add risk. Drawdown throttle & gross reduction Continuous drawdown gate monitoring. Automatic de-grossing triggers before any basket or portfolio-level limit is approached. No discretion required.	Also governed Hard logic for the critical failure mode 03 Historically stable G10 FX relationships decouple structurally. The entire control layer is built around this scenario. Four-step hard protocol: Detect Correlation stability monitored continuously. Break flagged instantly when thresholds are breached. BLOCK New entries immediately blocked in affected and related baskets no new risk while break is active. UNWIND Positions unwound in controlled slices, pace governed by current market liquidity. RE-ENGAGE Basket stays disabled until stability is proven over multiple sessions. Explicit criteria must be re-met.
--	---	---

Five risks. One critical. Higher vol is an advantage.

Unlike directional strategies, higher stress creates more dislocation opportunities for CA. Every risk is identified, monitored, and governed.

Risk	What it is	How we manage it
01 Critical Correlation Regime Breaks	The primary failure mode. Stable G10 FX relationships decouple structurally and fail to mean-revert the scenario the entire control layer is built around. No amount of sizing helps once a true structural break is underway.	Hard OFF logic: block entries instantly, unwind in controlled slices, basket stays disabled until stability is re-proven over multiple sessions. Explicit criteria must be met before re-engagement.
02 Medium Hedge Lag / Neutrality Leakage	In fast markets, hedge quality degrades slippage and correlation drift create short-lived directional FX exposure at the worst possible moments.	Continuous hedge monitoring. Auto re-hedge if hedges drift beyond tolerance. If neutrality cannot be restored, position size is cut or trading is paused immediately.
03 Medium Gap Risk Intraday / Overnight	Sudden central bank surprises or geopolitical shocks hit P&L before hedges can fully re-balance to the new regime.	Hard exposure caps at basket and portfolio level. Event/ regime gates reduce sizing pre-announcement. De-risk: size-down → pause → controlled unwind.
04 Managed Residual Exposure Drift	Cross-basket overlap can drift under stress, creating unintended concentration to USD, carry, or regional FX blocs a portfolio-level risk.	Real-time residual monitoring across all active baskets. Hard gross/net limits and concentration caps enforced continuously. Tighten hedges or cut gross if drift detected.
05 Advantage Higher Vol → More Opportunity	Unlike directional FX, higher stress creates wider dislocations and more convergence opportunities. Volatility is the edge, not the risk, for CA.	Scale through breadth more diversified hedged baskets at governed sizes, not more leverage. Pre-trade risk gates, smaller per-basket sizing, and tighter hedges govern footprint throughout.

Why the mechanism is structural

Institutional investors carry systematic obligations. When markets become uncertain, they are compelled to buy protection pushing implied vol above what realises (VPR’s harvest) and liquidity thins across FX markets, breaking correlation networks (CA’s harvest). Both mechanisms are structural. Neither can arbitrage away.

01 The Flow is Permanent

Institutions cannot stop hedging equities, and global FX flows never disappear. The vol premium and the correlation dislocation reappear every cycle neither can be arbitrated away.

02 Stress = More Opportunity

When vol spikes, VPR collects richer premium. When liquidity thins and FX correlations dislocate, CA earns wider convergence spreads. Both engines harvest more in the environments others retreat from.

03 Two Edges, One Framework

VPR and CA are uncorrelated to each other and to equities. Together they provide independent return streams both governed by a single risk architecture with predefined deterioration rules.

Q1 2022 UKRAINE INVASION

Energy shock → inflation at 40-year highs → institutions flood into S&P protection. Implied vol reprices above realised. G10 FX correlations fracture as capital re-routes.

NOW Iran war closes Strait of Hormuz → Brent +60% in March. IEA (Apr 1): ‘Worst energy crisis in history.’ Same shock, larger scale.

Q2 2022 FED SHOCK

Fastest Fed tightening since 1980 → forced selling → implied/ realised vol gap at multi-year extreme. Rate differentials reprice violently, breaking G10 FX correlations.

NOW Fed trapped between energy inflation and weakening growth. June cut probability: 80% → below 30%. Rate hike probability crossed 50%. Powell: ‘Another supply shock coming.’

FY 2022 THESIS PROVEN

Bonds AND equities fall together. Every institution needs protection. Hedging demand becomes structural. 60/40 worst year in decades.

NOW Bloomberg (Mar 13): ‘60/40 no help as war drives stagflation.’ BlackRock: ‘Bonds and gold not providing ballast.’ S&P worst quarter since 2022.

2026 | Confirmed Parallels

01 Geopolitical Rupture The Worst Energy Crisis in History

US-Israel strikes on Iran (Feb 28) → Strait of Hormuz closed Mar 4 → 20% of global oil supply (≈20M bpd) disrupted. Brent: \$71 → \$119 peak → \$112–116 current. IEA today (Apr 1): ‘We lost 12M bpd — more than two 1970s oil crises combined. April will be much worse than March.’ Largest IEA emergency release in history (400Mb) oil rose 17% after the announcement.

+60%

Brent crude March gain biggest since records began · 1980s

02 Stagflation Pressure Now Confirmed, Not Forecast

OECD revised its 2026 global inflation forecast to 4.2% as oil shock compounds existing tariff-driven stagflation. Rabobank: ‘stagflationary shock in the US economy.’ AllianzGI: ‘stagflationary dynamics amplified by tariff aftershocks.’ Wellington: ‘2026 will be a long way from Goldilocks.’ The Fed’s soft landing path is now actively threatened hawks vs. doves at maximum divergence.

4.2%

OECD revised 2026 global inflation forecast up from 2.x%

03 Equities Selling Off Hard Worst Quarter Since 2022

S&P 500 down ~7.7% in March and ~7% YTD. Nasdaq down 10%+. Advisor Perspectives (Mar 31): worst month and worst quarter since 2022. VIX peaked at 60.13, closed March 31 at 30.61 5 consecutive losing weeks on Wall Street. Moody’s AI recession model hit 49% before the Iran conflict. Goldman Sachs: only a severe and sustained oil price disruption, as in 1990 or 2022, would have large effects on global growth.

-7.7%

S&P 500 in March alone worst month since September 2022

04 60/40 Under Siege The Exact Parallel to 2022

Bloomberg (Mar 13): A 60/40 portfolio is no help as war drives stagflation bonds now moving in the same direction as stocks. BlackRock: There are few places to hide. Government bonds and gold are not providing ballast as equities fall. 10-year Treasury yields rose to 4.28% as stocks fell identical to 2022 when both equities (-18%) and bonds (-17.8%) collapsed simultaneously. That was the year our engines delivered VPR +28.35% and CA +18.60%.

Portfolio Construction Impact

Effect of a 15% VPR + 10% CA Allocation on a 60/40 Institutional Portfolio · Feb 2021 – Dec 2025

THE CONSTRUCTION

A 60/40 portfolio — global equities and investment-grade bonds is the baseline. A 15% VPR and 10% CA sleeve are added, funded from existing positions. The full 59-month period is live: no backtests, no simulations.

RETURN IMPACT

Return nearly doubled — 5.22% to 9.36% — while volatility fell from 10.66% to 8.04%. Higher return and lower risk simultaneously. This holds because both engines earn from mechanisms that have nothing to do with equity or bond direction.

DRAWDOWN & RISK-ADJUSTED RETURN

Sharpe Ratio up 212%. Maximum drawdown cut from -21.89% to -12.68%. Through 2022 — the worst year for 60/40 in decades — both engines stayed within limits: VPR -6.82%, CA -5.10%.

DIVERSIFICATION QUALITY

CA correlation to 60/40: 0.015. VPR equity beta: -0.15. Neither engine replicates what’s already in the portfolio. These are independent return streams that perform best when the rest of the portfolio is under pressure.

Portfolio Metrics	60/40 baseline	+15% VPR & +10% CA	Δ Change

Disclaimer

This document is provided for informational purposes only by Edge Capital Management B.V. (the “Manager”) and does not constitute an offer to sell, or a solicitation of an offer to buy, any securities, fund interests, or other financial instruments. Any such offer or solicitation may only be made pursuant to the Manager’s official offering documents, including but not limited to the confidential information memorandum, subscription documents, and related materials (collectively, the “Offering Documents”), which must be reviewed in full prior to making any investment decision. Nothing in this document constitutes investment, legal, accounting, or tax advice, nor does it represent a recommendation that any investment or strategy is suitable or appropriate to your individual circumstances.

Edge Capital Management B.V. is registered with the Dutch Authority for the Financial Markets (Autoriteit Financiële Markten, AFM) as an Alternative Investment Fund Manager (AIFM) under Article 2:66a of the Dutch Financial Supervision Act (Wet op het financieel toezicht, “Wft”) and is listed in the AFM’s public register of exempt AIFMs as referred to in Article 1:107 Wft, with registration number 50027774. The Manager is also registered with the Dutch Chamber of Commerce under number 63941805.

The funds and strategies referenced in this document are intended exclusively for professional investors within the meaning of Annex II of Directive 2014/65/EU (MiFID II) and Article 4(ag) of the AIFMD. This document is not directed at, and may not be distributed to, retail investors or any other persons who do not meet the applicable legal or regulatory requirements in their jurisdiction. The distribution of this document may be restricted by law in certain jurisdictions; persons into whose possession this document comes are required to inform themselves of and observe any such restrictions.

Investment in any alternative fund managed or advised by the Manager involves significant risks, including the potential loss of all or a substantial part of the invested capital. Past performance is not indicative of future results. No assurance can be given that any fund will achieve its investment objectives or that any investor will achieve returns comparable to those described herein, or any returns at all. Performance data may be shown on a gross basis and may not reflect deductions for management fees, performance fees, taxes, or other expenses, all of which would reduce actual returns.

Any performance data presented for periods prior to the launch of a regulated fund may be based on proprietary accounts, model portfolios, or other investment programs managed in a similar manner. Such performance is provided for illustrative purposes only and should not be interpreted as indicative of future results. Simulated or backtested results (if presented) are subject to inherent limitations and may not accurately reflect the actual performance that would have been achieved under real market conditions.

References to indices or benchmarks, including but not limited to the MSCI World Index, are provided solely for comparative purposes. The investment strategy employed by the Manager may differ materially from any index in terms of investment approach, composition, volatility, or other metrics. No representation is made that any fund is managed in reference to such indices, or that performance comparisons are indicative of future outcomes.

This document may contain forward-looking statements, projections, estimates, or forecasts that reflect the Manager’s current opinions and assumptions, which are subject to change without notice. These forward-looking statements are inherently uncertain and involve risks and uncertainties beyond the Manager’s control. Actual results and outcomes may differ materially from those expressed or implied in such statements. The Manager undertakes no obligation to update such information.

The Manager and its affiliates may maintain investment positions or other relationships that could give rise to potential conflicts of interest. Such conflicts are managed in accordance with internal policies and applicable regulatory requirements. Investors are encouraged to carefully review the Offering Documents and consult with their own independent legal, tax, accounting, and financial advisors before making any investment decision.

This document is confidential and may not be copied, reproduced, distributed, or disclosed, in whole or in part, to any third party without the prior written consent of Edge Capital Management B.V. It is intended solely for the use of the recipient to whom it has been provided by the Manager. Receipt of this document does not create any obligation or expectation of a future business relationship.

Edge Capital Management B.V. makes no representation or warranty, express or implied, as to the accuracy, completeness, or reliability of the information contained herein. This document is provided “as is” and is subject to change without notice.
